

Virtual Ticket Management and Escalation Simulation

Technical Support Specialist Internship

Runa

Introduction to Ticket Management

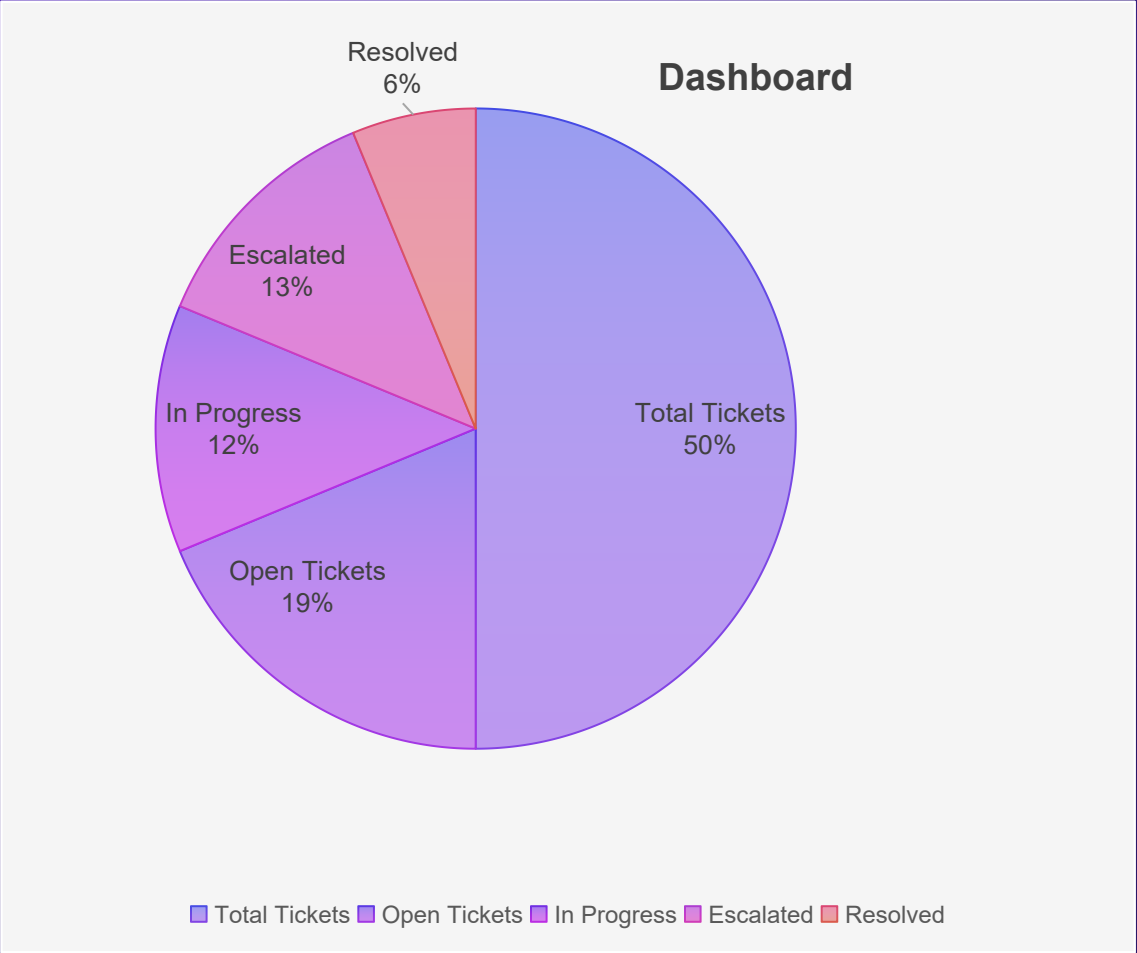

Ticket management is an important process in IT support used to track, organize, and resolve technical issues efficiently.

Support teams use ticketing systems to assign priorities, monitor progress, and escalate complex problems to specialized teams.

This simulation demonstrates how IT incidents are managed in a professional support environment.

Dashboard Overview

Total Tickets	Open Tickets	In Progress	Escalated	Resolved
8	3	2	2	1

Total Tickets: 8
Open Tickets: 3
Escalated: 2
Resolved: 1

Ticket Management Panel

Ticket ID	User Name	Issue Type	Discription	Priority	Status	Assigned Team	Escalation Level
INC001	Arya	Login Issue	Unable to login to Windows account	High	Open	L1 Support	None
INC002	Deva	Email Problem	Outlook emails not syncing	High	Escalated	Email Admin Team	L2
INC003	Riya	Network Issue	Slow internet connection in office	Medium	In Progress	Network Team	None
INC004	Anur	VPN Issue	VPN connection failed during remote work	High	Escalated	Network Security Team	L2
INC005	Lakshi	Hardware Issue	Printer not responding	Low	Open	Hardware Team	None
INC006	Saanchi	Software Installation	Zoom installation failed	Medium	In Progress	Desktop Support	None
INC007	Priya	System Crash	Blue screen error on startup	Critical	Open	System Admin Team	L3
INC008	Arun	Password Reset	User forgot account password	Low	Resolved	Helpdesk Support	None

Ticket Analysis 1

Incident Log — INC001

Issue:

User unable to login to Windows account.

User Impact:

Employee unable to access office system.

Priority:

High

Preliminary Troubleshooting:

- Checked keyboard functionality
- Verified internet connection
- Attempted password reset

Escalation Decision:

Escalated to Identity Access Management Team because account authentication issue required advanced permission verification.

Ticket Analysis 2

Incident Log — INC004

Issue:

VPN connection failed during remote work.

User Impact:

Remote employee unable to connect to company network.

Priority:

High

Preliminary Troubleshooting:

- Restarted VPN client
- Checked internet connectivity
- Reconfigured VPN settings

Escalation Decision:

Escalated to Network Security Team due to firewall and remote access configuration requirements.

Ticket Analysis 3

Incident Log — INC007

Issue:

Blue screen error during system startup.

User Impact:

Complete system failure affecting work productivity.

Priority:

Critical

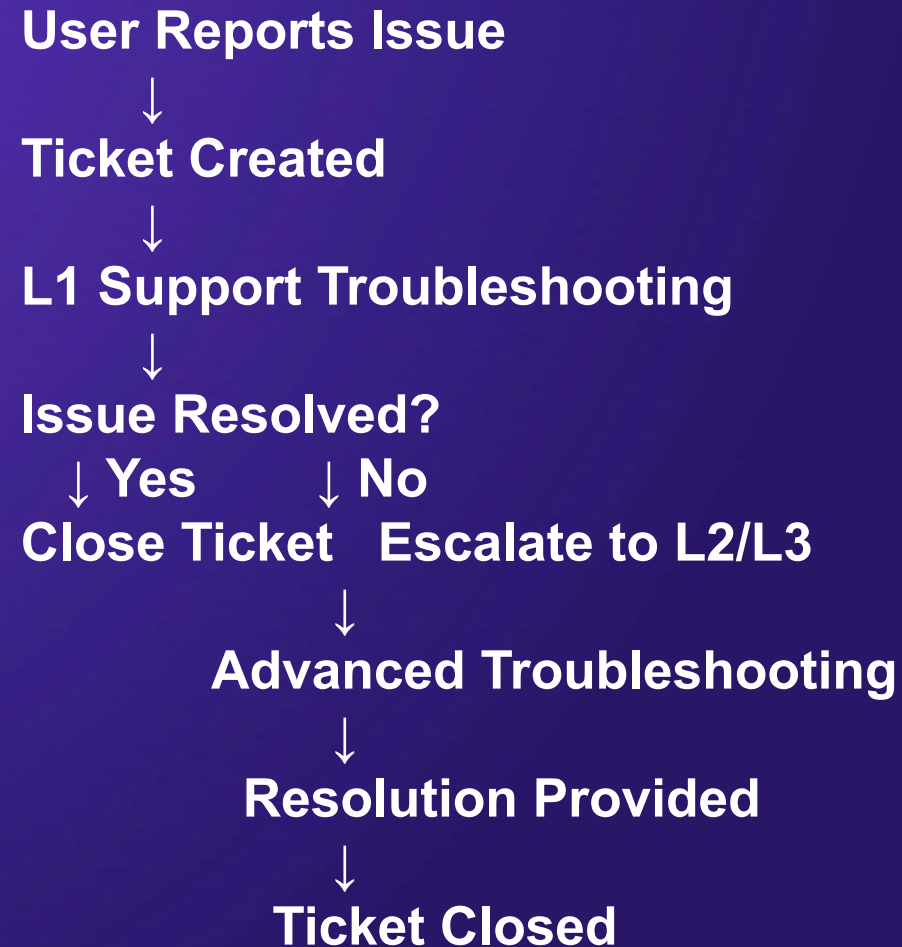

Preliminary Troubleshooting:

- Restarted system
- Booted into safe mode
- Checked hardware connections

Escalation Decision:

Escalated to System Administration Team because operating system diagnostics and hardware investigation were required.

Ticket Escalation Workflow

Ticket Priority Classification

Priority	Meaning	Response Time
Critical	Business operations affected	Immediate
High	Major productivity issue	Within 1 Hour
Medium	Partial functionality issue	Within 4 Hours
Low	Minor issue	Within 24 Hours

Conclusion

- This simulation improved my understanding of ticket management, incident prioritization, troubleshooting processes, and escalation workflows in IT support environments.
- I learned how support teams organize technical issues systematically and ensure timely resolution through structured communication and escalation methods.
